

Client for calculating household
pension and value from income

Samu Peltonen

Two features

- Calculating and comparing annual household income to US average
- Calculating how much pension the household would get (with a lot of approximations)

Wealth

← → 📄 💰 ▼ http://localhost:8080/soaharkka/ ▼ ▶ 🌐

Client for calculating household pension and if your household income is above the US median

Your annual income: Possible partner's income:

seventy thousand dollars is over median household income (by +\$13484)

Pension

← → 📄 🔄 http://localhost:8080/soaharkka/ ▶ 🔍

Client for calculating household pension and if your household income is above the US median

Your annual income: Possible partner's income:

two thousand six hundred and twenty five dollars per month

Business logic

- A small application delivered to banks or other financing establishments
- Quickly informs their customer of a couple of specifics and gives them more of an idea what their situation is
- And after that the two parties can continue their business with clearer understanding where the customer currently is

Used resources

- Number Conversion Service provides functions that convert numbers into words or dollar amounts. (<http://www.dataaccess.com/webservicesserver/numberconversion.wso?WSDL>)
- Was used to modify the outputs of the program
- Calculator (<http://www.dneonline.com/calculator.asmx?WSDL>) supports the following operations: add, divide, multiply, subtract.
- Was planned to do all the calculations required

Shortcomings and potential updates

- Calculator class doesn't work, features have been implemented by hand
- Pension calc could be a lot more valid service if it would take more variables into consideration, related to both the specifics of career, and the state where user lives
- Wealth calc could also get more specific info from web (accurate percentiles)
